### Chemical Compounds

The present invention relates to piperidine derivatives, to processes for their preparation, to pharmaceutical compositions containing them and to their medical use.

In particular the invention relates to novel compounds which are potent and specific antagonists of tachykinins, including substance P and other neurokinins.

WO 97/16440 describes 1-(1,2-disubstituted piperidiny)-4-substituted piperazine derivatives of general formula

wherein n and m are inter alia 1, p is 1; Q is inter alia oxygen; X is a covalent bond or a bivalent radical of formula -O-, -S-, NR<sup>3</sup>; R<sup>3</sup> is hydrogen or a C<sub>1-6</sub> alkyl group; R<sup>1</sup> is inter alia Ar<sup>1</sup>; R<sup>2</sup> may be inter alia Ar<sup>2</sup>C<sub>1-6</sub>alkyl wherein Ar<sup>2</sup> and Ar<sup>1</sup> are inter alia a phenyl group which may be substituted with 1, 2 or 3 substituents each independently selected from halo, C<sub>1-4</sub>alkyl, haloC<sub>1-4</sub> alkyl, L may be inter alia hydrogen, C<sub>1-6</sub> alkyl or L is a radical of formula -(CHR<sup>4</sup>)<sub>r</sub>C(O)Y<sup>1</sup>R<sup>7</sup>, wherein r is 0,1,2,3 or 4, Y<sup>1</sup> is inter alia a NH or a N(C<sub>1-6</sub> alkyl) group or Y<sup>1</sup> is a covalent bond and R<sup>7</sup> is inter alia C<sub>1-6</sub> alkyl or C<sub>3-7</sub> cycloalkyl. The compounds are antagonists of tachykinins.

We have now found a particular class of compounds which is not specifically disclosed therein, which class has special advantages.

We have discovered that by selection of particular substituents (namely a piperazin-1-yl substituent at the 4- position of the piperidine ring, substituted phenyl alkyl amide groups at the 1-position and substituted

phenyl groups at the 2- position) a class of compounds having advantageous properties in the treatment of conditions mediated by tachykinins is obtained.

- 20 Suitable pharmaceutical acceptable salts of the compounds of general formula (I) may be obtained in a crystalline form and/or in an amorphous form or as a mixture thereof.

- It will be appreciated by those skilled in the art that the compounds of formula (I) contain at least two chiral centres (namely the carbon atoms shown as \* in formula (I)) and these may be represented by the formulae (1a, 1b, 1c and 1d).

The wedge shaped bond indicates that the bond is above the plane of the paper and is referred to as  $\beta$  configuration. The broken bond indicates that the bond is below the plane of the paper and is in the  $\alpha$  configuration.

In general, in the specific compounds named below the  $\beta$  configuration at the 2 position corresponds to the R configuration and the  $\beta$  configuration at 4 position corresponds to the S configuration. The  $\alpha$  configuration at the 2 position corresponds to the S configuration and the  $\alpha$  configuration at 4 position corresponds to the R configuration. The assignment of the R or S configuration at the 2 and the 4 positions have been made according to the rules of Cahn, Ingold and Prelog, *Experientia* 1956,12, 81.

The configuration of the chiral carbons atom of the piperidine ring shown in 1a and 1b is hereinafter referred to as anti configuration and in formulae 1c and 1d as the syn configuration.

Further asymmetric carbon atoms are possible in the compound of formula (I). Thus, when  $R_2$  and  $R_3$  are not the same group, the compounds of formula (I) possess at least three asymmetric carbon atoms.

It is to be understood that all enantiomers and diastereoisomers and mixtures thereof are encompassed within the scope of the present invention.

The compounds of the invention are antagonists of tachykinins, including substance P and other neurokinins, both in vitro and in vivo and are thus of use in the treatment of conditions mediated by tachykinins, including substance P and other neurokinins.

NK<sub>1</sub>-receptor binding affinity has been determined in vitro by the compounds' ability to displace [3H] - substance P (SP) from recombinant human NK<sub>1</sub> receptors expressed in Chinese Hamster Ovary (CHO) cell membranes.

CHO cell membranes were prepared by using a modification of the method described by Dam T and Quirion R (Peptides, 7:855-864, 1986). Thus ligand binding was performed in 0.4 ml of 50 mM HEPES, pH 7.4, containing 3 mM MnCl<sub>2</sub>, 0.02% BSA, 0.5 nM [<sup>3</sup>H]Substance P (30÷56 Ci/mmol, Amersham), a final membrane concentration of 25 µg of protein/ml, and the test compounds. The incubation proceeded at room temperature for 40 min.. Non-specific binding was determined using excess of Substance P (1 µM) and represents about 6% of the total binding.

Compounds of the invention were further characterised in a functional assay for the determination of their inhibitory effect. Human-NK<sub>1</sub>-CHO cells were stimulated with Substance P and the receptor activation was evaluated by measuring the accumulation of cytidinediphosphodiacylglycerol (CDP-DAG), which is the liponucleotide precursor of phosphatidylinositol diphosphate. CDP-DAG accumulates in the presence of Li<sup>+</sup> as a consequence of the receptor mediated activation of phospholipase C (PLC) (Godfrey, Biochem. J., 258:621-624, 1989). The method is described in detail by Ferraguti et al. (Mol. Cell. Neurosci., 5:269-276, 1994).

The action of the compounds of the invention at the NK<sub>1</sub> receptor may be determined by using conventional tests. Thus the ability to penetrate the central nervous system and to bind at the NK<sub>1</sub> receptor was demonstrated in vivo by their inhibitory effect on the change in the behaviour induced by intracerebroventricular applied substance P in the gerbil, according to the gerbil foot tapping model as described by Rupniak & Williams, Eur. J. of Pharmacol., 1994,.

The compounds of the invention may be formulated for parenteral administration by bolus injection or continuous infusion. Formulations for injection may be presented in unit dosage form e.g. in ampoules or in multi-dose containers, with an added preservative. The compositions may take such forms as suspensions, solutions or emulsions in oily or aqueous vehicles, and may contain formulatory agents such as suspending, stabilising and/or dispersing agents. Alternatively, the active ingredient may be in powder form for constitution with a suitable vehicle, e.g. sterile pyrogen-free water, before use.

The compounds of the invention may be formulated for topical administration in the form of ointments, creams, gels, lotions, pessaries, aerosols or drops (e.g. eye, ear or nose drops). Ointments and creams may, for example, be formulated with an aqueous or oily base with the addition of suitable thickening and/or gelling agents. Ointments for administration to the eye may be manufactured in a sterile manner using sterilised components.

Lotions may be formulated with an aqueous or oily base and will in general also contain one or more emulsifying agents, stabilising agents, dispersing agents, suspending agents, thickening agents, or colouring agents. Drops may be formulated with an aqueous or non-aqueous base also comprising

one or more dispersing agents, stabilising agents, solubilising agents or suspending agents. They may also contain a preservative.

The compounds of the invention may also be formulated in rectal compositions such as suppositories or retention enemas, e.g. containing conventional suppository bases such as cocoa butter or other glycerides.

The compounds of the invention may also be formulated as depot preparations. Such long acting formulations may be administered by implantation (for example subcutaneously or intramuscularly) or by intramuscular injection. Thus, for example, the compounds of the invention may be formulated with suitable polymeric or hydrophobic materials (for example as an emulsion in an acceptable oil) or ion exchange resins, or as sparingly soluble derivatives, for example, as a sparingly soluble salt.

For intranasal administration, the compounds of the invention may be formulated as solutions for administration via a suitable metered or unitary dose device or alternatively as a powder mix with a suitable carrier for administration using a suitable delivery device.

A proposed dose of the compounds of the invention is 1 to about 1000mg per day. It will be appreciated that it may be necessary to make routine variations to the dosage, depending on the age and condition of the patient and the precise dosage will be ultimately at the discretion of the attendant physician or veterinarian. The dosage will also depend on the route of administration and the particular compound selected.

Compounds of formula (I), and salts and solvates thereof, may be prepared by the general methods outlined hereinafter. In the following description, the groups R, R<sub>1</sub>, R<sub>2</sub>, R<sub>3</sub>, R<sub>4</sub>, R<sub>5</sub>, R<sub>6</sub> m and n, have the meaning as previously defined for compounds of formula (I) unless otherwise stated.

Compounds of formula (I) may be prepared by reductive N-alkylation of a compound of formula (II),

- 5 with a piperazine derivative (III) in an aprotic solvent such as dichloroethane and in the presence of a suitable metal reducing agent such as sodium borohydride or sodium triacetoxyborohydride.

10 Compounds of formula (II) may be prepared by treating compounds of formula (IV)

- 15 with triphosgene in an aprotic solvent such as dichloromethane and in the presence of an organic base such triethylamine to form the intermediate carbonyl chloride compound (V) which may be isolated if required, followed by reaction of compound (V) with the amine compound (VI)

The reaction conveniently takes place in an aprotic solvent such as a hydrocarbon, a halohydrocarbon such as dichloromethane or an ether such as tetrahydrofuran optionally in the presence of a base such as a tertiary amine e.g. diisopropylethylamine.

Where it is desired to isolate a compound formula (I) as a salt, for example a pharmaceutically acceptable salt, this may be achieved by reacting the compound of formula (I) in the form of the free base with an appropriate amount of suitable acid and in a suitable solvent such as an alcohol (e.g. ethanol or methanol), an ester (e.g. ethyl acetate) or an ether (e.g. diethyl ether or tetrahydrofuran).

Pharmaceutically acceptable salts may also be prepared from other salts, including other pharmaceutically acceptable salts, of the compounds of formula (I) using conventional methods.

Compounds of formula (III), (IV), (V) and (VI) may be prepared by analogous methods to those used for known compounds.

The compounds of formula (I) may readily be isolated in association with solvent molecules by crystallisation from or evaporation of an appropriate solvent to give the corresponding solvates.

When a specific enantiomer of a compound of general formula (I) is required, this may be obtained for example by resolution of a corresponding enantiomeric mixture of a compound of formula (I) using conventional methods.

Thus, for example, specific enantiomers of the compounds of formula (I) may be obtained from the corresponding enantiomeric mixture of a compound of formula (I) using chiral HPLC procedure.

Alternatively, enantiomers of a compound of general formula (I) may be synthesised from the appropriate optically active intermediates using any of the general processes described herein.

Thus for example the required enantiomer may be prepared by the corresponding a chiral piperidin-4-one of formula (IV) using the process described above for preparing compounds of formula (I) from compounds (IV), followed by separation of the diastereomeric mixture of a compound of formula(I) using conventional procedure.

The chiral compounds (IV) may be prepared from the corresponding racemic compound (IV) using conventional procedures such as salt formation with a suitable optically active acid, separating the resultant diastereoisomeric salts by conventional means e.g. chromatography and crystallisation followed by hydrolysis of the diastereoisomeric salts. A suitable optically active acid for use in the process is L(+)-mandelic acid.

In a further embodiment of the invention the chiral compound (IV) may be prepared using Comins reaction as described in Journal American Chemical Society 1994,116, 4719-4728, followed by reduction of 2,3 dihydro-1H-pyridin-4-one derivative to piperidin-4-one derivative. The reduction may be effected using hydrogen and metal catalyst e.g. palladium on a suitable support e.g. carbon or alumina. The reaction is carried out in a solvent such as ester e.g. ethyl acetate.

In a further embodiment of the invention the enantiomers of the compound of formula (I) may be prepared by reaction of a chiral amine (VI) using any of the processes described above for preparing compounds of formula (I) from amine (V).

The chiral amine (III) may be prepared from the corresponding racemic amine (III) using any conventional procedures such as salt formation with a suitable optically active acid.

The invention is further illustrated by the following Intermediates and Examples which are not intended as a limitation of the invention.

In the Intermediates and Examples unless otherwise stated:

Melting points (m.p.) were determined on a Buchi m.p. apparatus and are uncorrected. R.T. or r.t. refer to room temperature.

Infrared spectra (IR) were measured in chloroform or nujol solutions on a FT-IR instrument. Proton Magnetic Resonance (NMR) spectra were recorded on Varian instruments at 400 or 500 MHz, chemical shifts are reported in ppm ( $\delta$ ) using the residual solvent line as internal standard. Splitting patterns are designed as s, singlet; d, double; t, triple; q, quartet; m, multiplet; b, broad. Mass spectra (MS) were taken on a VG Quattro mass spectrometer. Optical rotations were determined at 20°C with a Jasco DIP360 instrument ( $l=10$  cm, cell volume = 1 mL,  $\lambda$  = 589 nm). Flash silica gel chromatography was carried out over silica gel 230-400 mesh supplied by Merck AG Darmstadt, Germany. T.l.c. refers to thin layer chromatography on 0.25 mm silica gel plates (60F-254 Merck) and visualized with UV light.

Solutions were dried over anhydrous sodium sulphate.

Methylene chloride was redistilled over calcium hydride and tetrahydrofuran was redistilled over sodium.

The following abbreviations are used in the text: AcOEt = ethyl acetate, CH = cyclohexane, DCM = methylene chloride, DIPEA = N,N-diisopropylethylamine, DMF = N,N'-dimethylformamide, Et<sub>2</sub>O = diethyl ether, EtOH = ethanol, MeOH = methanol, TEA = triethylamine, THF = tetrahydrofuran.

A small amount of iodine was added to a suspension of magnesium turnings (13.2 g) in dry THF (300 mL), at r.t., under a nitrogen atmosphere, then the mixture was vigorously refluxed for 20 minutes. To this suspension, a 15% of a solution of 2-bromo-5-fluoro-toluene (52.5 mL) in anhydrous THF (300 mL) was added. The suspension was heated under vigorous reflux until the brown colour disappeared. The remaining part of the bromide solution was added drop-wise over 1 hour to the refluxing suspension which was then stirred for a further 1 hour. This solution of Grignard reagent was then added drop-wise to the pyridinium salt obtained

from benzyl chloroformate (48.7 mL) and 4-methoxypyridine (25 mL) in dry THF (900 mL) at -23°C.

The obtained solution was stirred 1 hour at -20°C then it was warmed up to 20°C, a 10% hydrochloric acid solution (560 mL) was added and the aqueous layer was extracted with AcOEt (2 x 750 mL).

The combined organic extracts were washed with 5% sodium hydrogen carbonate solution (600 mL) and brine (600 mL) then partially concentrated *in vacuo*.

CH (400 mL) was added drop-wise over 1 hour at 20°C and the resulting mixture was stirred 30 minutes and then filtered to give the title compound as a white solid (66 g).

#### Method A

2-Methyl-4-fluoro-benzaldehyde (4 g) was added to a solution of 4-aminobutan-2-one ethylene acetal (3.8 g) in dry benzene (50 mL) and the solution was stirred at r.t. under a nitrogen atmosphere. After 1 hour the mixture was heated at reflux for 16 hours and then allowed to cool to r.t.

This solution was slowly added to a refluxing solution of p-toluensulphonic acid (10.6 g) in dry benzene (50 mL) previously refluxed for 1 hour with a Dean-Stark apparatus. After 3.5 hours the crude solution was cooled and made basic with a saturated potassium carbonate solution and taken up with AcOEt (50 mL). The aqueous phase was extracted with AcOEt (3 x 50 mL) and Et<sub>2</sub>O (2 x 50 mL). The organic layer was dried and concentrated *in vacuo* to a yellow thick oil as residue (7.23 g). A portion of the crude mixture (3 g) was dissolved in a 6N hydrochloric acid solution (20 mL) and stirred at 60°C for 16 hours. The solution was basified with solid potassium carbonate and extracted with DCM (5 x 50 mL). The combined organic

phases were washed with brine (50 mL), dried and concentrated *in vacuo* to give the title compound (2.5 g) as a thick yellow oil.

**Intermediate 10****2-(R)-4-Fluoro-2-methyl-phenyl)-4-oxo-piperidine-1-carboxylic acid, (3,5-bis-trifluoromethyl-benzyl)-methylamide****Method A**

A solution of triphosgene (17 mg) in dry DCM (2 mL) was added to a solution of intermediate 8 (26 mg) and DIPEA (65 mg) in dry DCM (3 mL) previously cooled to 0°C under a nitrogen atmosphere. After two hours acetonitrile (10 mL) was added, the temperature was allowed to reach r.t. and the DCM evaporated under a nitrogen flush. Then, a solution of 3,5-(bis-trifluoromethyl-benzyl)-methylamine hydrochloride (74 mg) and DIPEA (130 mg) in acetonitrile (3 mL) was added and the mixture was stirred at 23°C overnight. The solvent was concentrated *in vacuo*. The residue was dissolved in AcOEt (10 mL) and washed with 1N hydrochloric acid solution (3 x 5 mL), 5% sodium hydrogen carbonate (5 mL) and brine (10 mL). The organic layer was dried and concentrated *in vacuo* to a residue, which was purified by flash chromatography (CH<sub>2</sub>/AcOEt 1:1) to give the title compound (50 mg) as a white solid.

**Method B**

A saturated sodium hydrogen carbonate solution (348 mL) was added to a solution of intermediate **9** (23.2 g) in AcOEt (348 mL) and the resulting mixture was vigorously stirred for 15 minutes. The aqueous layer was back-extracted with further AcOEt (230 mL) and the combined organic extracts were dried and concentrated *in vacuo* to give intermediate **8** (12.31 g) as a yellow oil, which was treated with TEA (20.5 mL) and AcOEt (123 mL). The solution obtained was added drop-wise over 40 minutes to a solution of triphosgene (8 g) in AcOEt (61 mL) previously cooled to 0°C under a nitrogen atmosphere, maintaining the temperature between 0°C and 8°C.

After stirring for 2 hours at 20°C, 3,5-(bis-trifluoromethyl-benzyl)-methylamine hydrochloride (28.1 g), AcOEt (184 mL) and TEA (33 mL) were added to the reaction mixture which was then further stirred for 2 hours at 20°C.

The solution was washed with 10% sodium hydroxide solution (3 x 185 mL) and 1% hydrochloric acid solution (3 x 185 mL). The organic layer was dried and concentrated *in vacuo* to a crude (38 g), which was purified through a silica pad (CH<sub>2</sub>Cl<sub>2</sub>/AcOEt from 9:1 to 1:1) to give the title compound (24.7 g) as a colourless oil.

- The affinity of the compound of the invention for NK1 receptor was determined using the NK<sub>1</sub>-receptor binding affinity method measuring in vitro by the compounds' ability to displace [3H] - substance P (SP) from recombinant human NK<sub>1</sub> receptors expressed in Chinese Hamster Ovary (CHO) cell membranes. The affinity values are expressed as negative logarithm of the inhibition constant (K<sub>i</sub>) of displacer ligands (pK<sub>i</sub>).

- The pK<sub>i</sub> values obtained as the average of at least two determinations with representative compounds of the invention are given in the following table:

Example No	pki
2	9.36

3	10.29
7a	9.15
7b	10.13
8	9.68
9	9.93
10	9.94
12	9.91
14	10.00
15	10.34
16	10.36
19	9.38

The ability of the compounds of the invention to penetrate the central nervous system and to bind at the nk1 receptor may be determined using the gerbill foot tapping model as described by Rupniak & Williams, Eur. Jour. of Pharmacol., 1994.

The compound was orally administered and four hours later an NK1 agonist (e.g. delta-Aminovaleryl<sup>6</sup>[Pro<sup>9</sup>,Me-Leu<sup>10</sup>]-substance P (7-11)) (3pmol in 5μL icv) was infused directly in the cerebral ventricles of the animals. The duration of hind foot tapping induced by the NK1 agonist (e.g. delta-Aminovaleryl<sup>6</sup>[Pro<sup>9</sup>,Me-Leu<sup>10</sup>]-substance P (7-11)) was recorded continuously for 3 min using a stopwatch. The dose of the test compound required to inhibit by 50% the tapping induced by the NK1 agonist (e.g. delta-Aminovaleryl<sup>6</sup>[Pro<sup>9</sup>,Me-Leu<sup>10</sup>]-substance P (7-11)) expressed as mg/kg is referred as the ED<sub>50</sub> values. Alternatively the compounds may be administered subcutaneously or intraperitoneally.

Representative results obtained for compounds of the invention when given by oral administration are given in the following table

Ex N°	ED 50 (mg/kg)
3	0.05
7b	0.19
12	0.27

Examples Nos 47, 49 and 52 described in WO 97/16440 have shown in the gerbil foot tapping model no ability up to 1mg/Kg to penetrate the central nervous system when orally administered 4 hours before the administration of an NK1 agonist (e.g. delta-Aminovaleryl<sup>6</sup>[Pro<sup>9</sup>,Me-Leu<sup>10</sup>]-substance P (7-11)) (3pmol in 5μL icv).

No untoward effects have been observed when compounds of the invention have been administered to the gerbil at the pharmacological active doses.
